

Task 6: Useful GitHub CLI (gh) Tricks

1. gh api — Make GitHub API Calls

View your GitHub user information:

```
gh api user
```

List repositories:

```
gh api user/repos
```

Get repository details:

```
gh api repos/OWNER/REPO
```

Why useful:

- Access GitHub API without Postman or curl
- Automate repository management
- Build DevOps automation scripts

2. gh gist — Manage GitHub Gists

Create a gist:

```
echo "Hello World" > demo.txt  
gh gist create demo.txt
```

Create a public gist:

```
gh gist create demo.txt --public
```

List gists:

```
gh gist list
```

View a gist:

```
gh gist view GIST_ID
```

Why useful:

- Share code snippets quickly
 - Store configuration examples
 - Share troubleshooting notes
-

3. gh release — Manage Releases

Create a release:

```
gh release create v1.0.0 --title "Version 1.0.0" --notes "Initial Release"
```

List releases:

```
gh release list
```

View release details:

```
gh release view v1.0.0
```

Delete a release:

```
gh release delete v1.0.0
```

Why useful:

- Publish software versions
 - Attach build artifacts
 - Automate release pipelines
-

4. gh alias — Create Custom Shortcuts

Create an alias:

```
gh alias set prs "pr list"
```

Use alias:

```
gh prs
```

List aliases:

```
gh alias list
```

Delete alias:

```
gh alias delete prs
```

Examples:

```
gh alias set myrepos "repo list"  
gh alias set checks "run list"  
gh alias set myprs "pr list --author @me"
```

Why useful:

- Save time on repetitive commands
- Increase terminal productivity

5. gh search repos — Search GitHub Repositories

Search DevOps repositories:

```
gh search repos devops
```

Search Docker repositories:

```
gh search repos docker
```

Search repositories by language:

```
gh search repos "language:javascript react"
```

Search repositories with many stars:

```
gh search repos "devops stars:>1000"
```

Why useful:

- Discover open-source projects
- Find learning resources
- Explore production-grade repositories

Bonus Commands

View workflow runs:

```
gh run list
```

View workflow logs:

```
gh run view
```

Watch workflow execution:

```
gh run watch
```

Create pull request:

```
gh pr create
```

List pull requests:

```
gh pr list
```

Clone repository:

```
gh repo clone OWNER/REPO
```

Delete repository:

```
gh repo delete OWNER/REPO --yes
```

Real-World DevOps Usage

- Automate GitHub Actions monitoring
- Trigger releases from CI/CD pipelines
- Create pull requests from scripts
- Query GitHub APIs for reporting
- Manage repositories without leaving the terminal
- Integrate GitHub operations into shell automation
